1.3 Outlier detection and removal using Z score

Z score indicates how many standard deviation away a datapoint is.

For example in our case mean is 66.37 and the standard deviation is 3.84

If a value of data point is 77.91, then Z score for that is 3 because it is 3 standard deviation away (77.91 = 66.37 + 3 * 3.84)

Score is refer to data point below

994

Male

78.095867 3.048271

```
1.4 z = (x - ) /
